## The Right Balance For The Environment

Several state and local governments have taken steps toward banning the use of lead wheel weights in their jurisdictions. Some have already banned the use of lead wheel weights on state and local fleets. Fortunately, BADA has the right weight, right now, for customers looking for a practical alternative to lead: BADA steel wheel weights.

BADA was the first manufacturer to offer steel wheel weights in North America—and our products are now being used by leading automakers as original equipment. Three of the world's largest tire retailers have also chosen the BADA steel line.

BADA steel wheel weights offer the dual benefits of environmentally friendly steel plus our patented **CLIP-IN-MASS DESIGN** that delivers superior fit, just like the wheel weights you've always gotten from us. And the coating completely seals the weight and clip to prevent chemical reactions that result in unsightly discoloration and damage to the rim surface.

### PATENTED CLIP-IN-MASS DESIGN

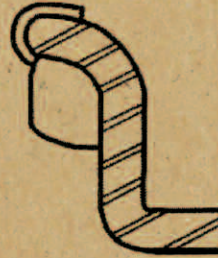

#### Higher Quality, Superior Fit

1. Unique **CLIP-IN-MASS DESIGN** puts the clip in the mass of the weight for superior fit—just like traditional wheel weights.
2. More 1-spin balances—they're smaller than other non-lead weights, so the center of gravity is closer to the point where the weight is attached.
3. All BADA steel wheel weights are coated with a special metallic coating process to enhance corrosion resistance and protect wheel appearance.

## Our Most Popular Steel Wheel Weight Styles Available Now!
